

# Techrospective

## Issues:

- **Mutable** HTTP model
- **Boilerplate** around application setup is **bloated**
- **Magic** around routing proving hard to debug
- **Hard to test** end-to-end scenarios
- Functional **Java vs native Kotlin** woes

**Action:** Let's try something that is **Kotlin-native**

# BarelyMagical

- **Hackday project**
- **Kotlin wrapper for Utterlyidle**
  - Use it as a library
  - Simple routing
  - Server as a function
